# Getting to Know Accessibility Features that Can Help with Hearing

iOS

**Live Listen** —If someone you love has a hard time hearing someone talking or even a TV show, turn on this feature (create a shortcut) and turn your iPhone into a wireless microphone. Great for crowded spaces also.

**Sound Recognition** —Boiling water in the tea kettle? Miss the doorbell or the telephone ring? Turn on this feature and your phone (Android & iOS) will listen for these things and alert your device and/or watch.

**Closed Captioning** —Combines audio with a visual, providing more support if you or your loved one struggles to understand what is being said in a video whether it is due to hard of hearing, background noise, or an unfamiliar accent.

**Type to Siri** —Ever want to use Siri without using your voice? Get SIRI to be your personal assistant, but you don't have to speak.

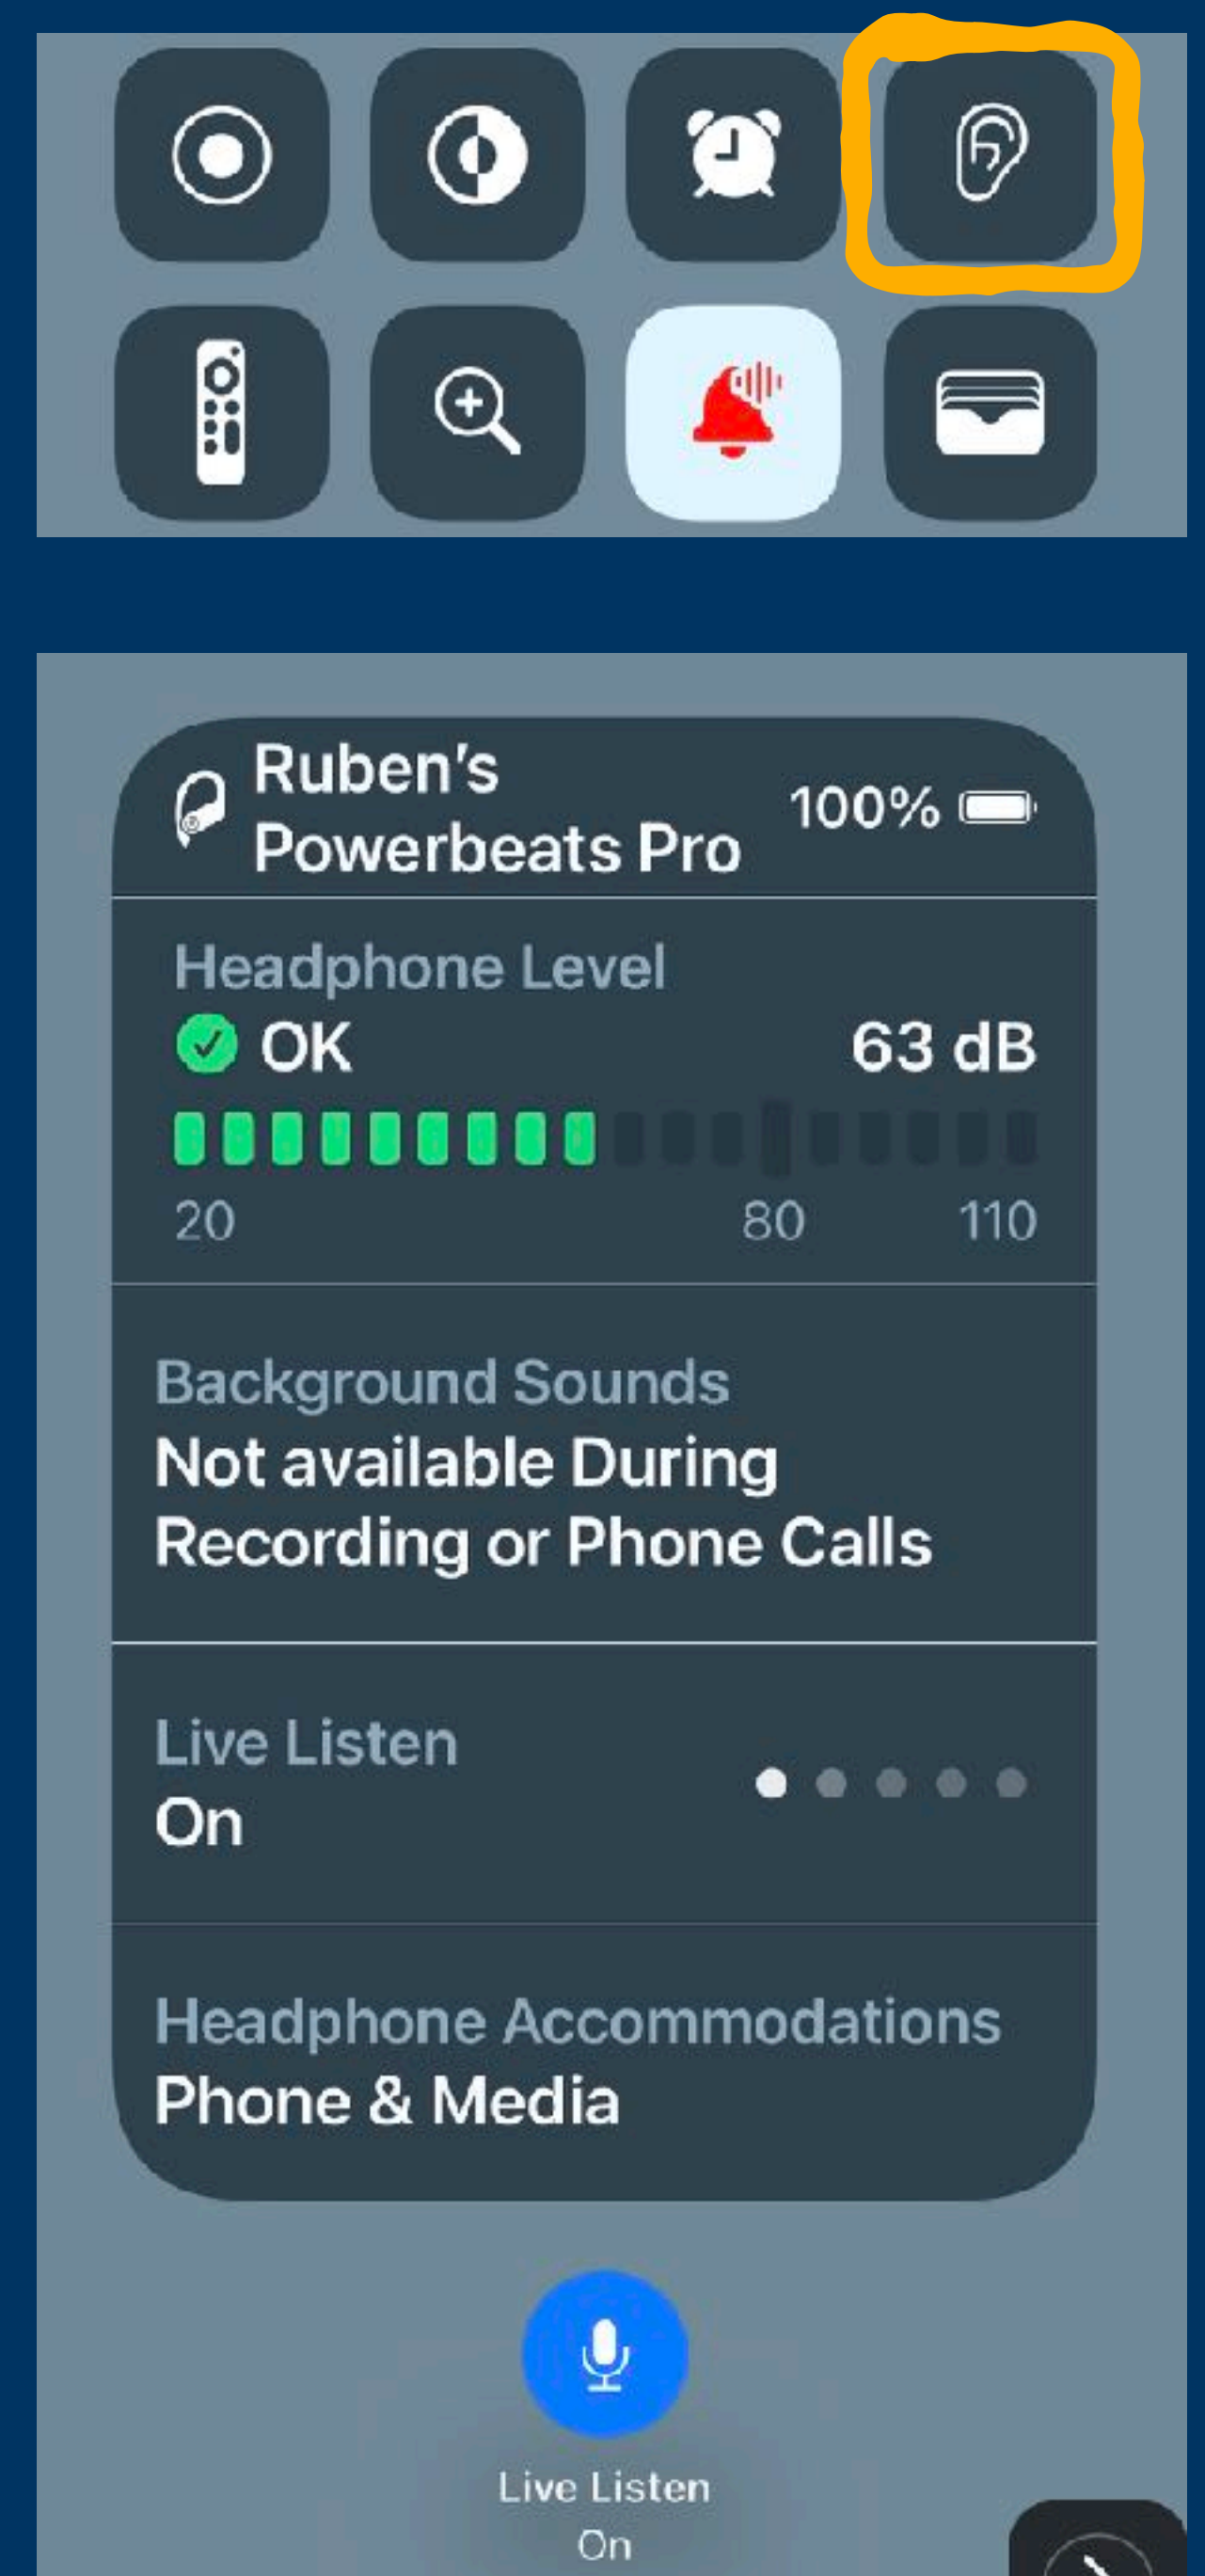

**Visual Flash for Alerts** — Use your phone's camera flash as an extra alert for notifications. Can also be useful if you don't want to interrupt others.

## Live Listen

If someone you love has a hard time hearing someone talking or even a TV show, turn on this feature (create a shortcut) and turn your iPhone into a wireless microphone. Great for crowded spaces also. You can even put your phone in one room and walk into another room and still hear what is going on in the other room.

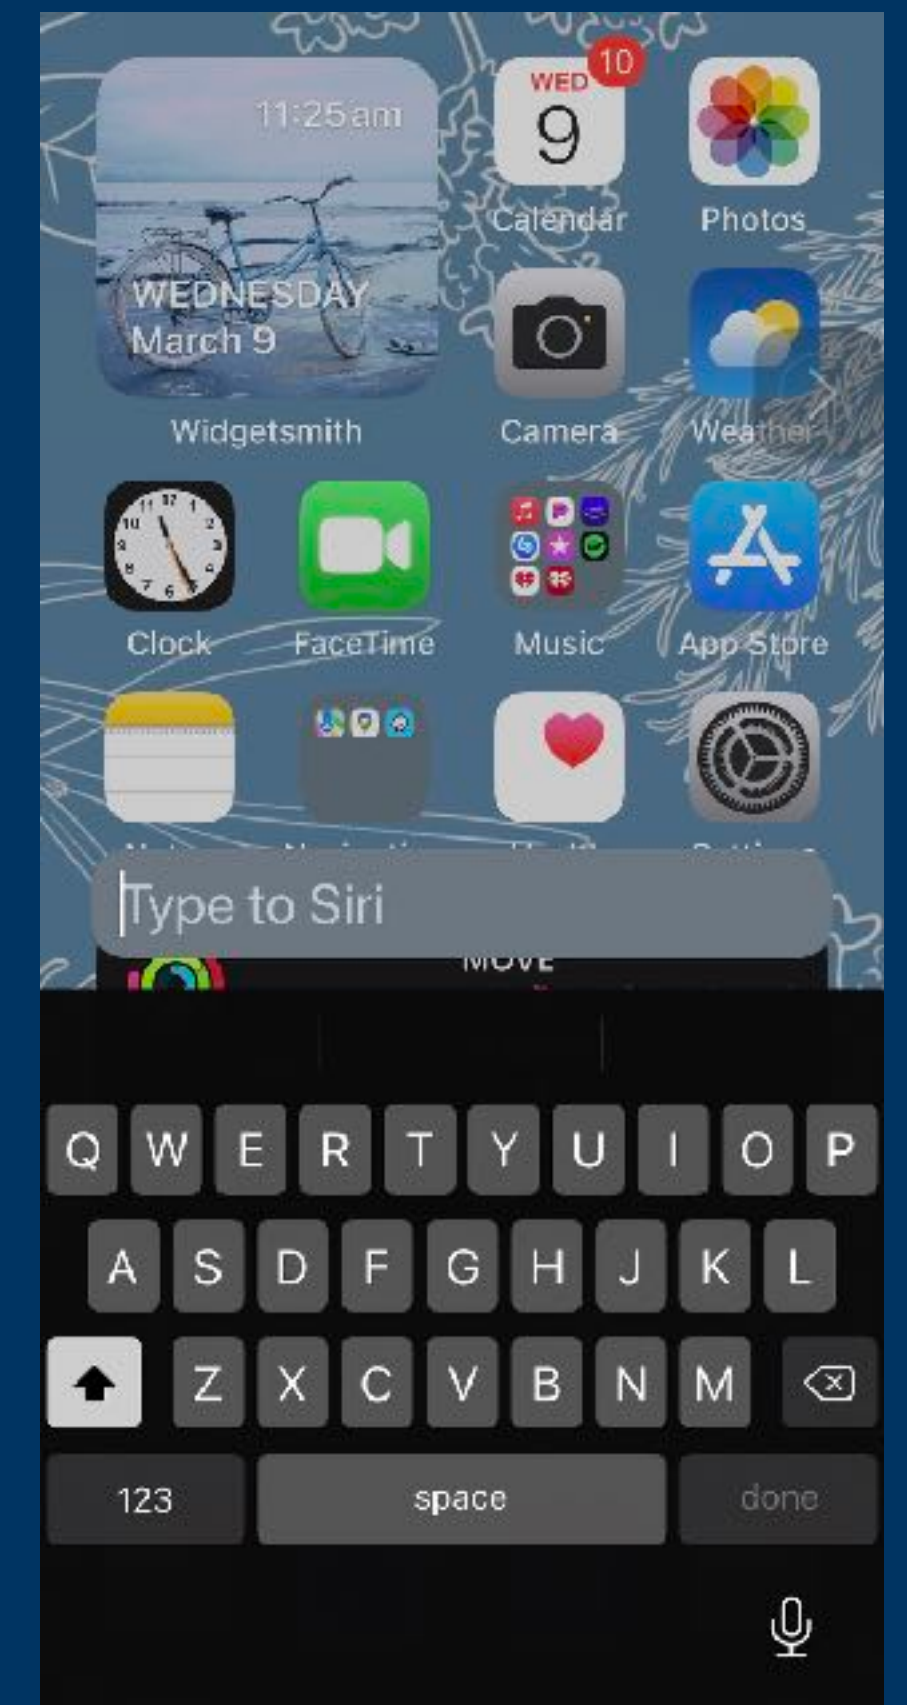

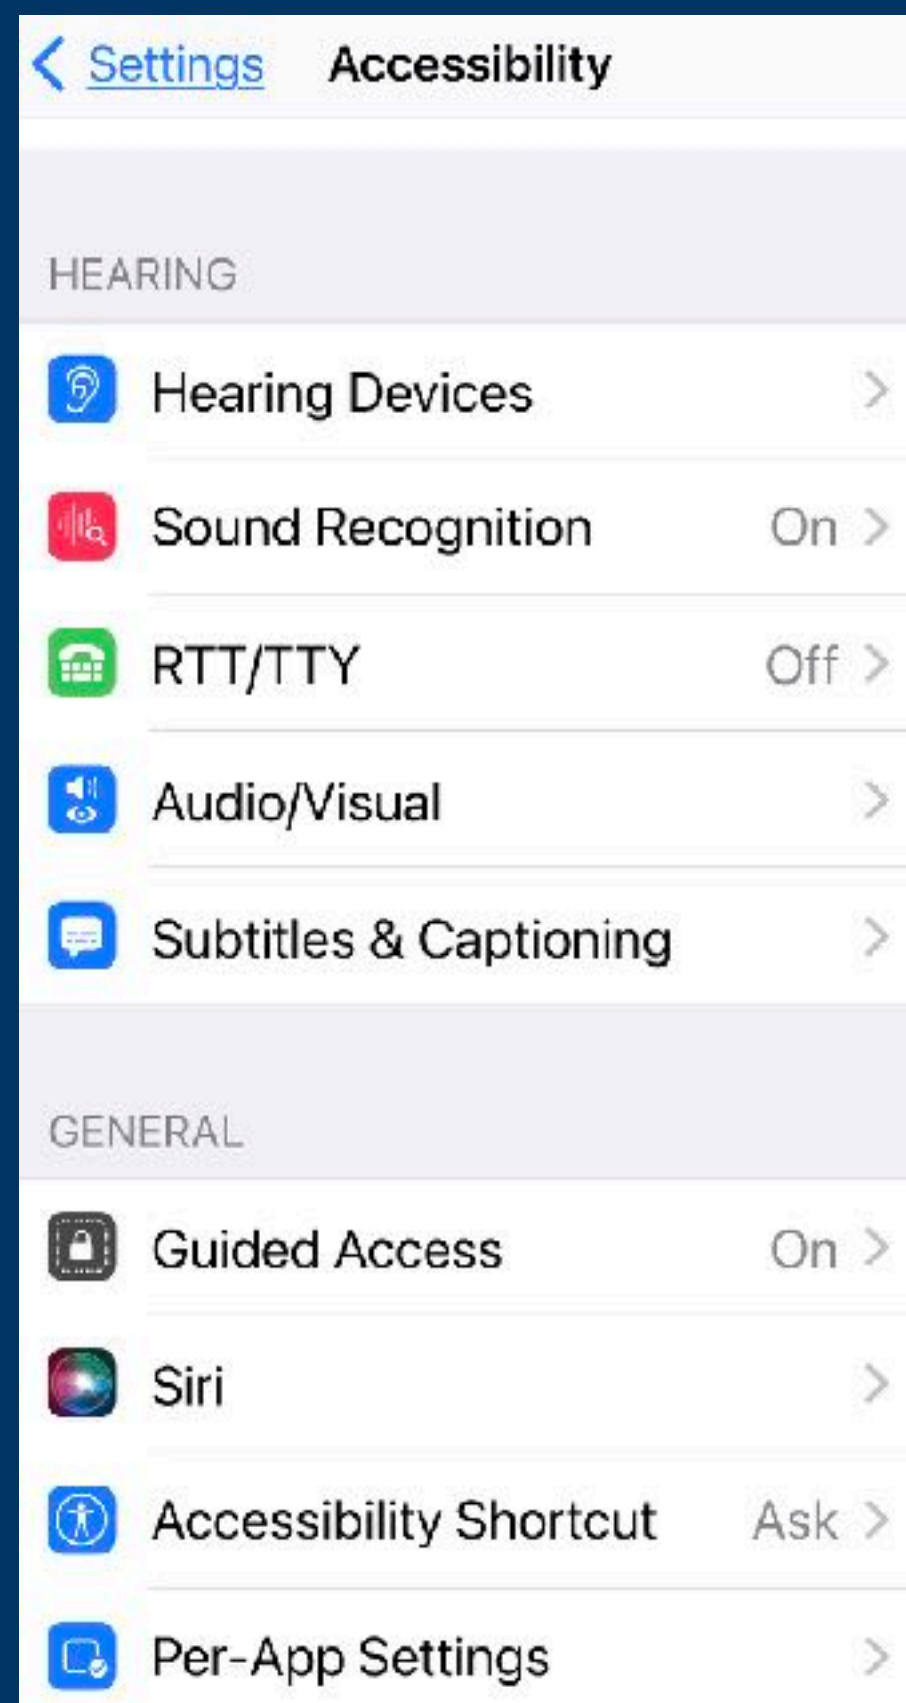

# Type to Siri

Type to Siri —Ever want to use Siri without using your voice? Get SIRI to be your personal assistant, but you don't have to speak. Turn on this setting and the keyboard pops up allowing you ask Siri would you normally would with your voice.

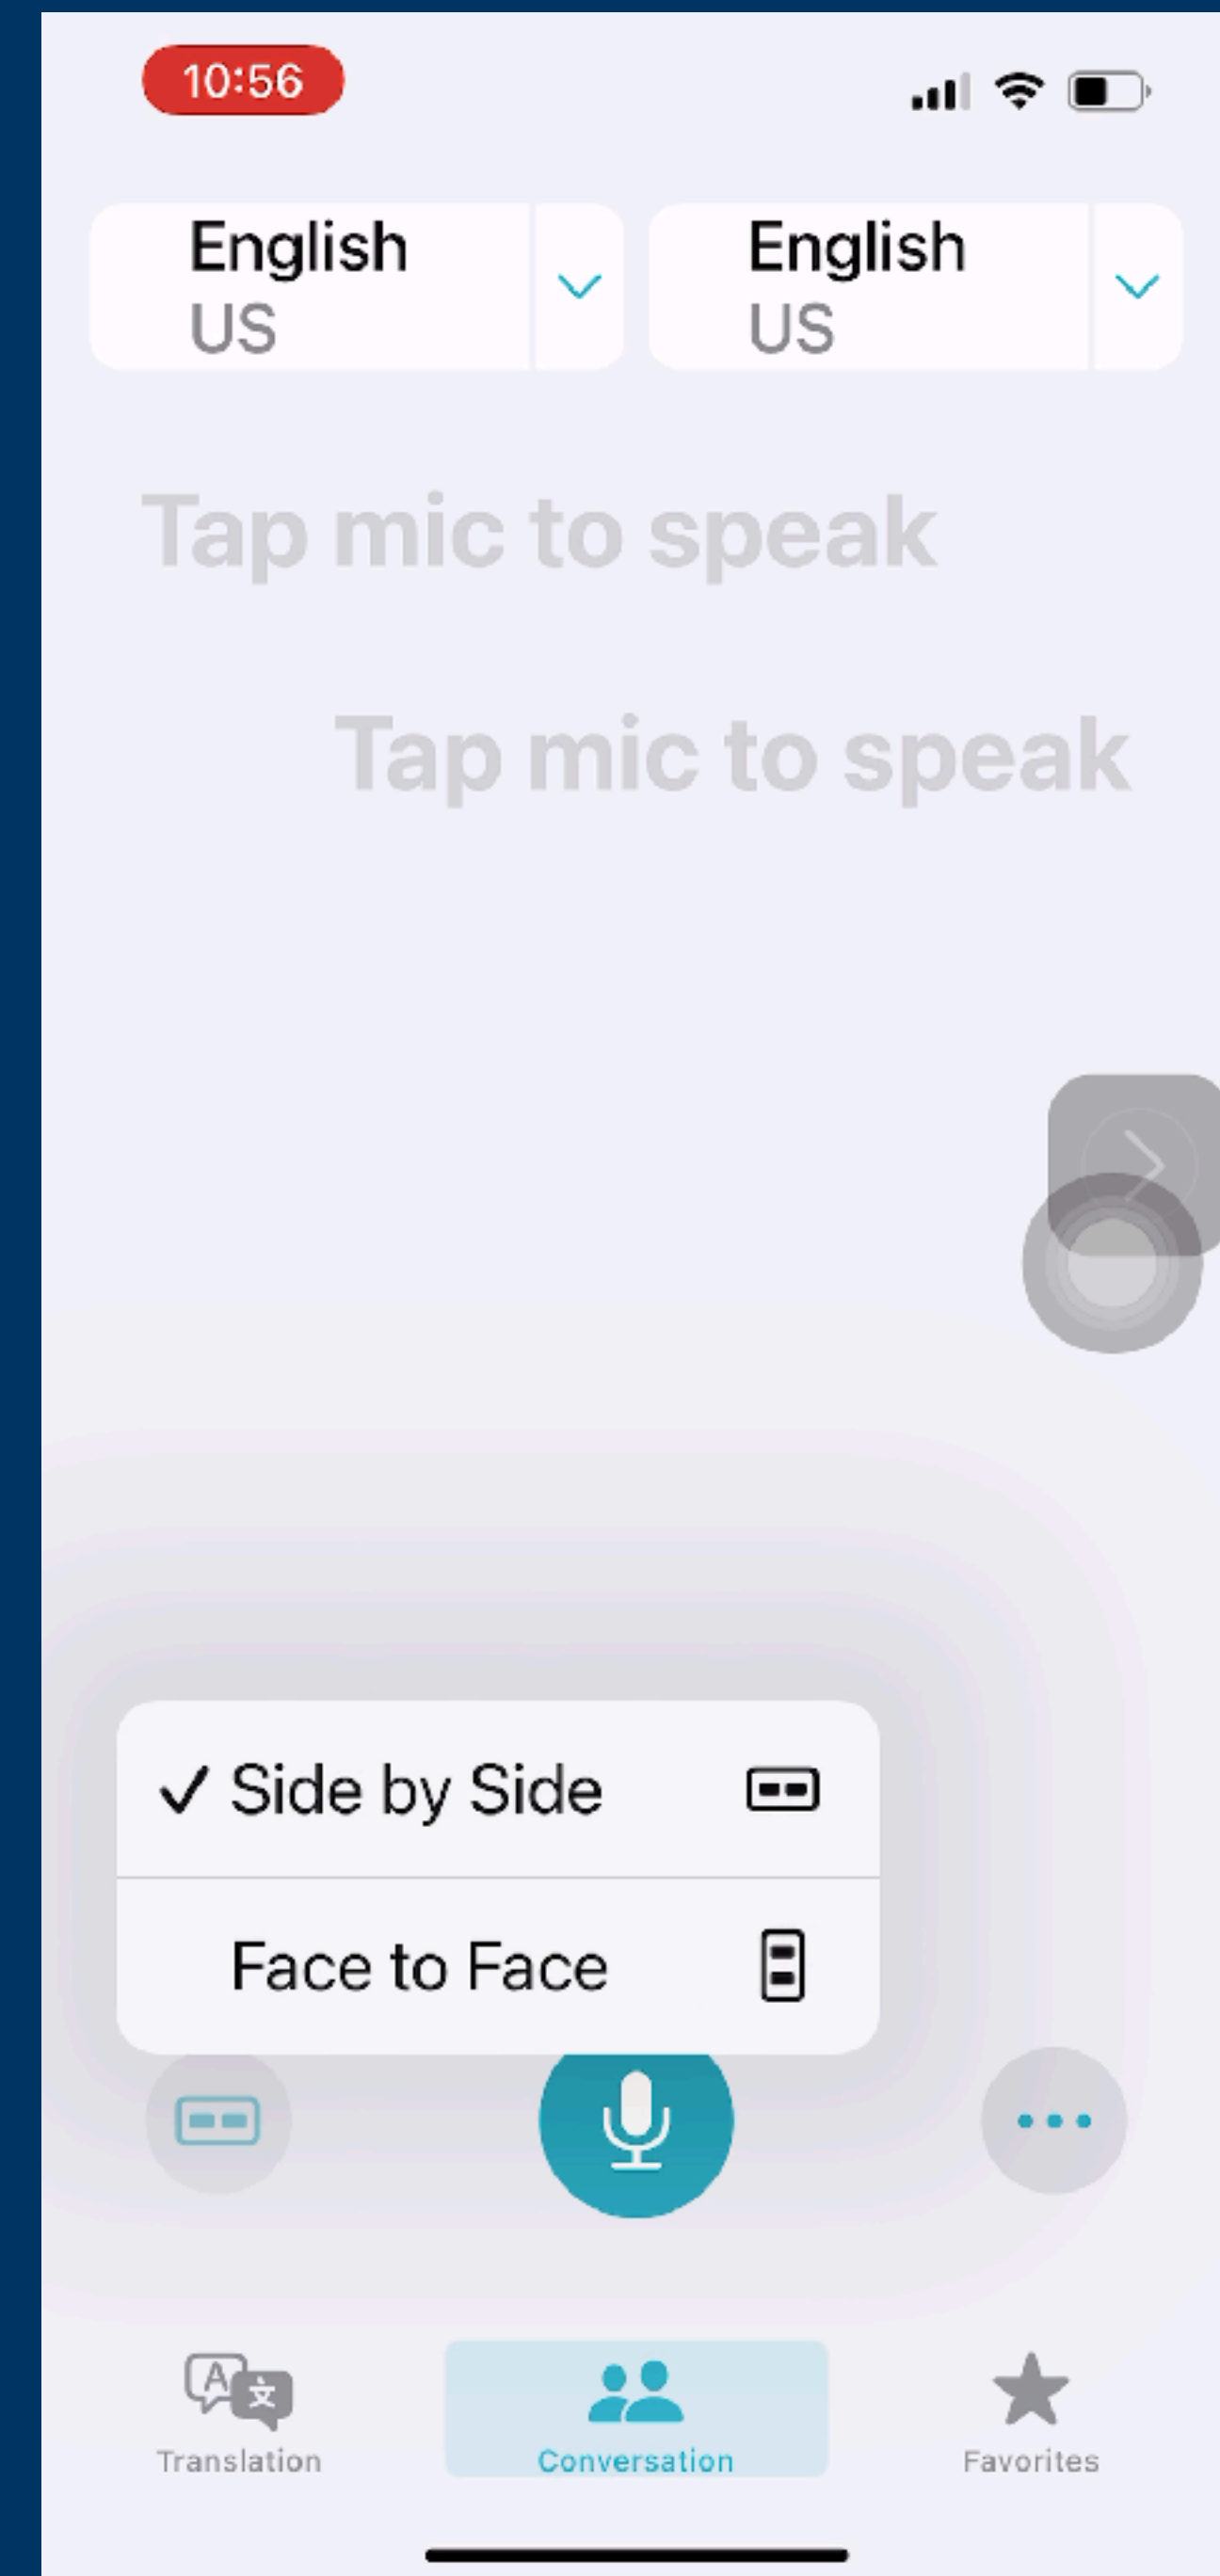

# Use Native and Third Party Apps

Apple Translate (iOS) & Google Translate (Android) allow users to use their device to communicate with someone using their phone. Use your phone to type, transcribe and playback, making ordering in a restaurant easier.

RogerVoice - uses Live transcribe on any call

AVA - Live Transcription

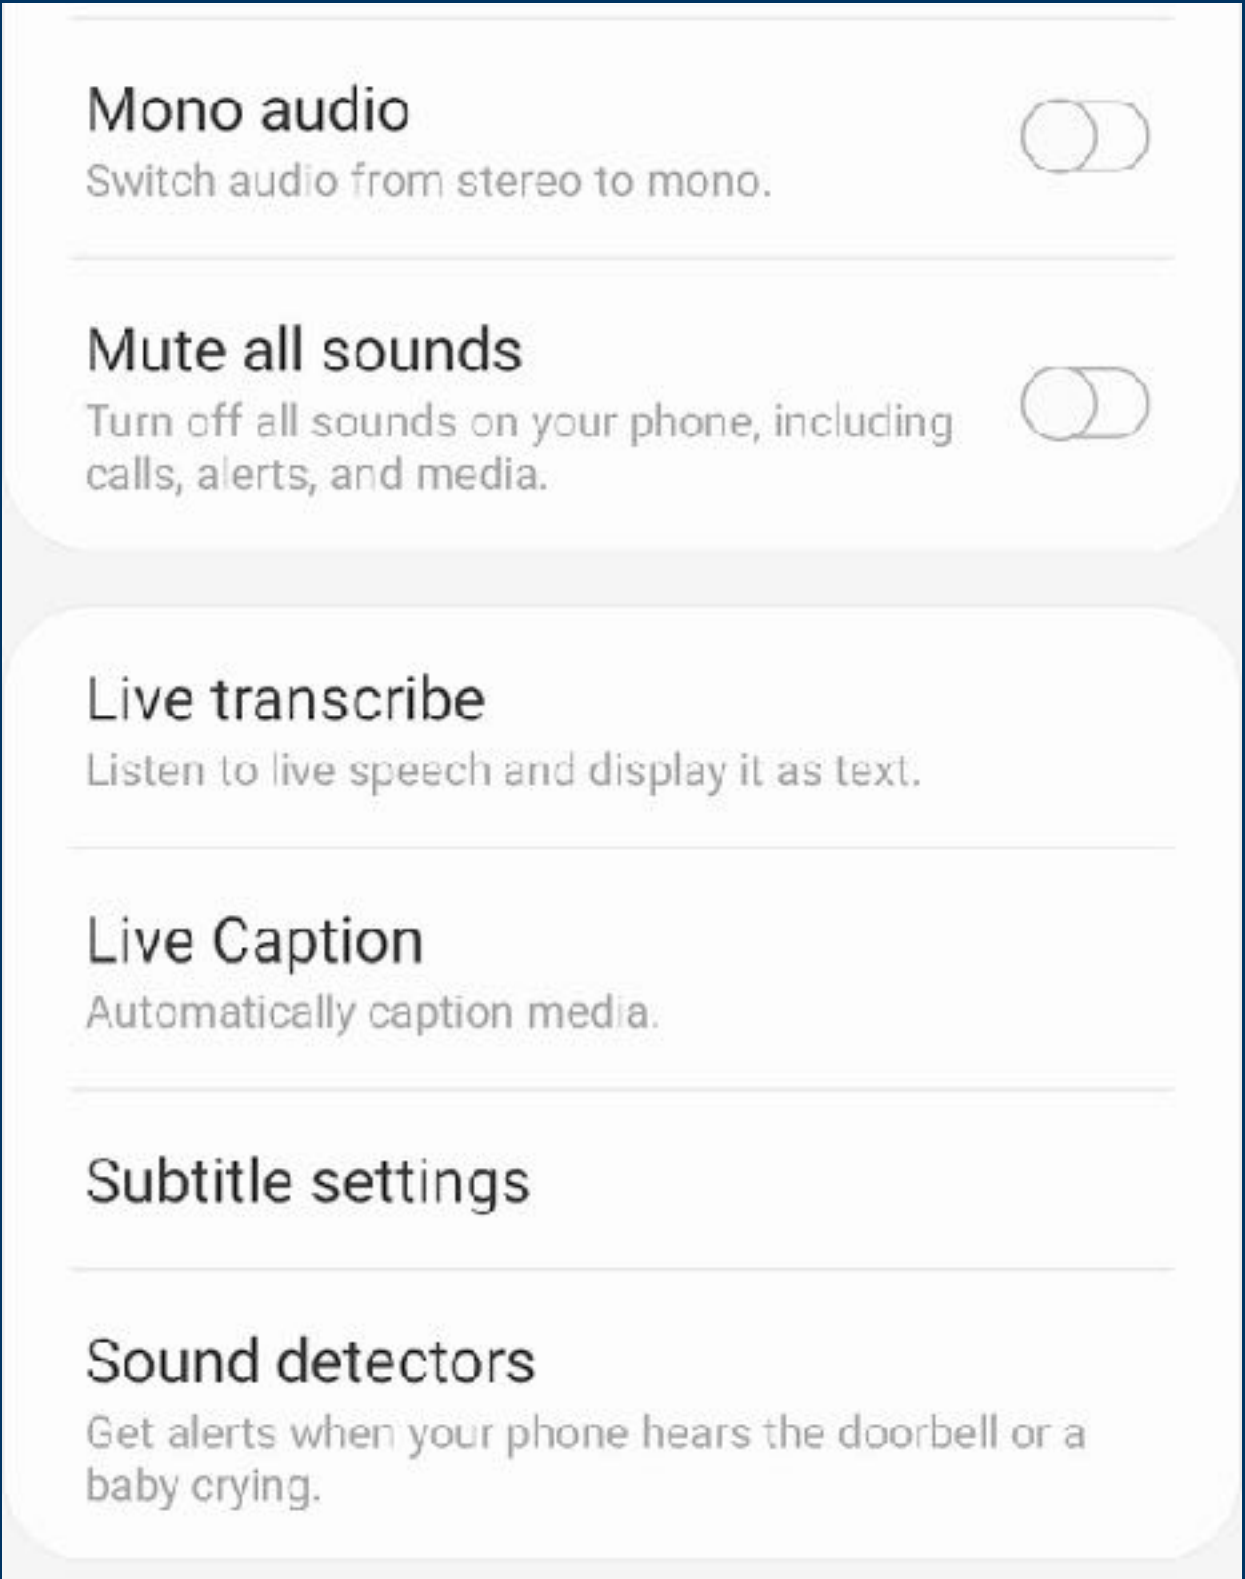

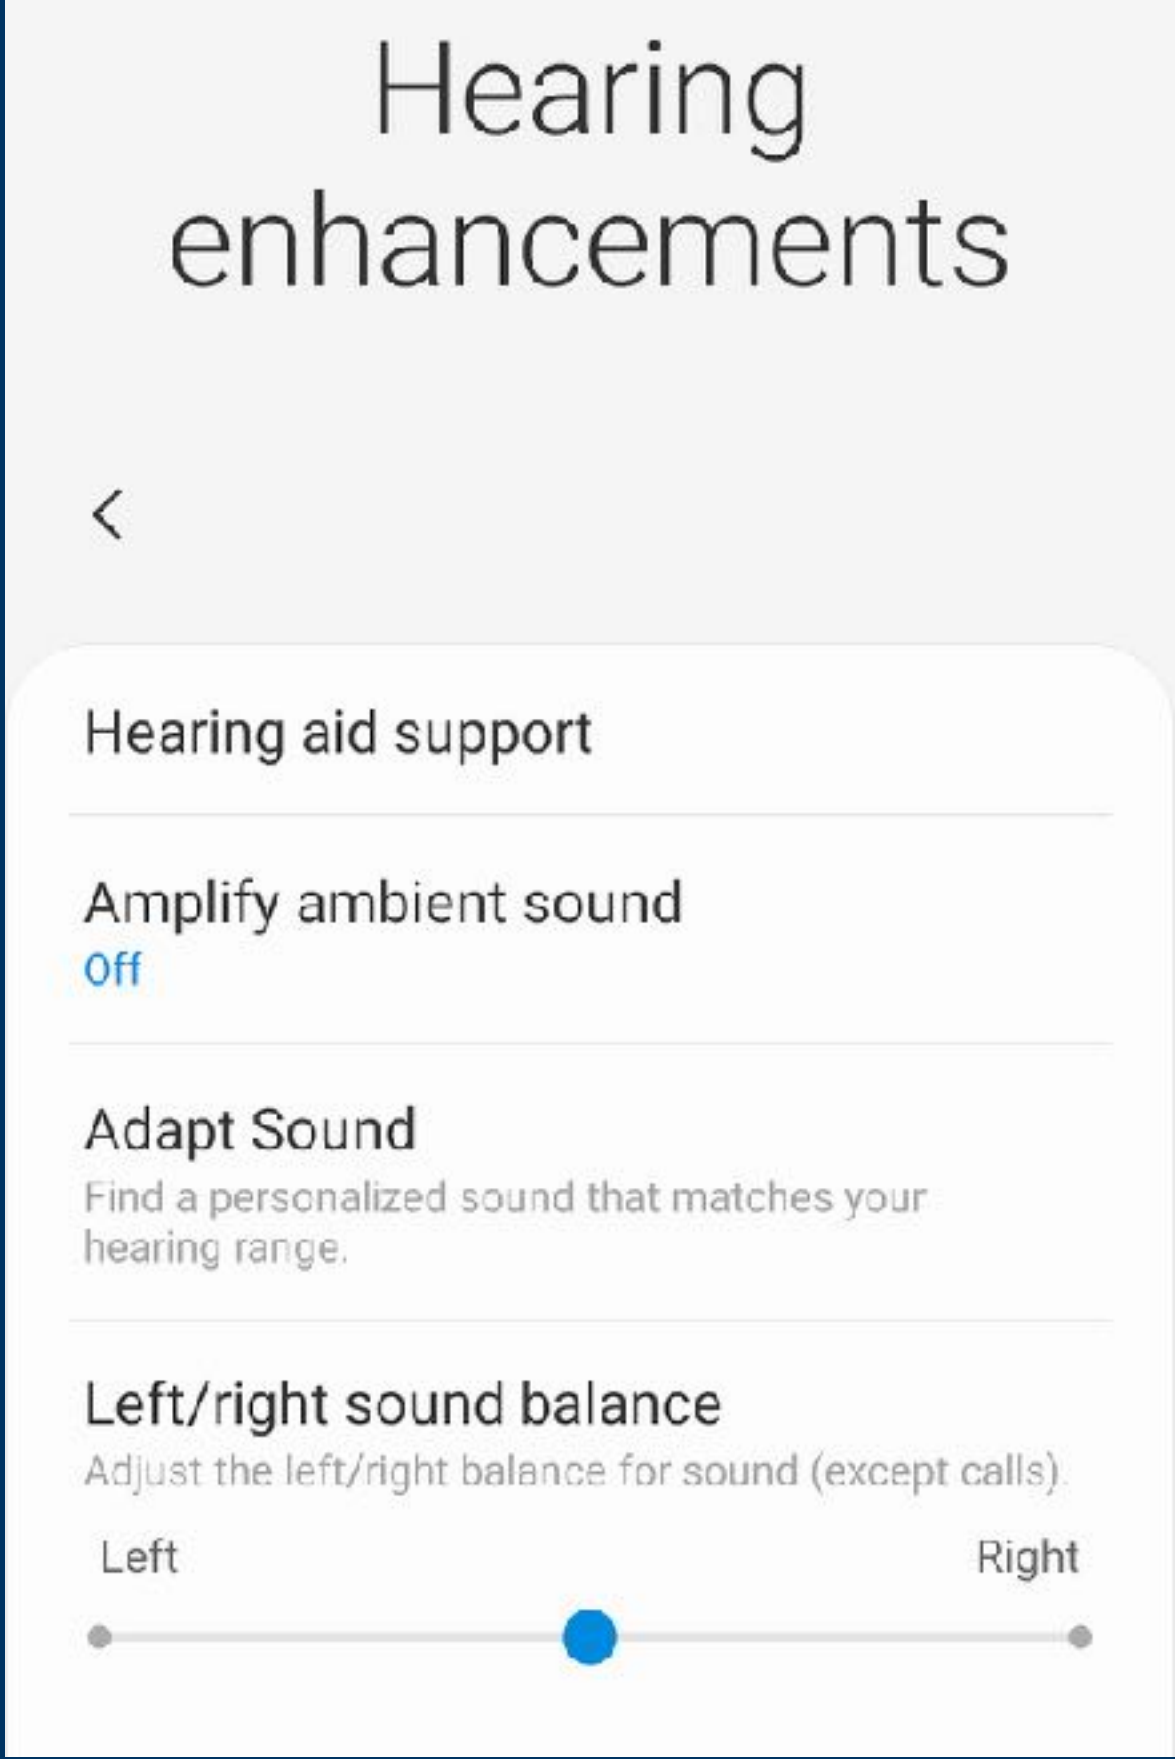

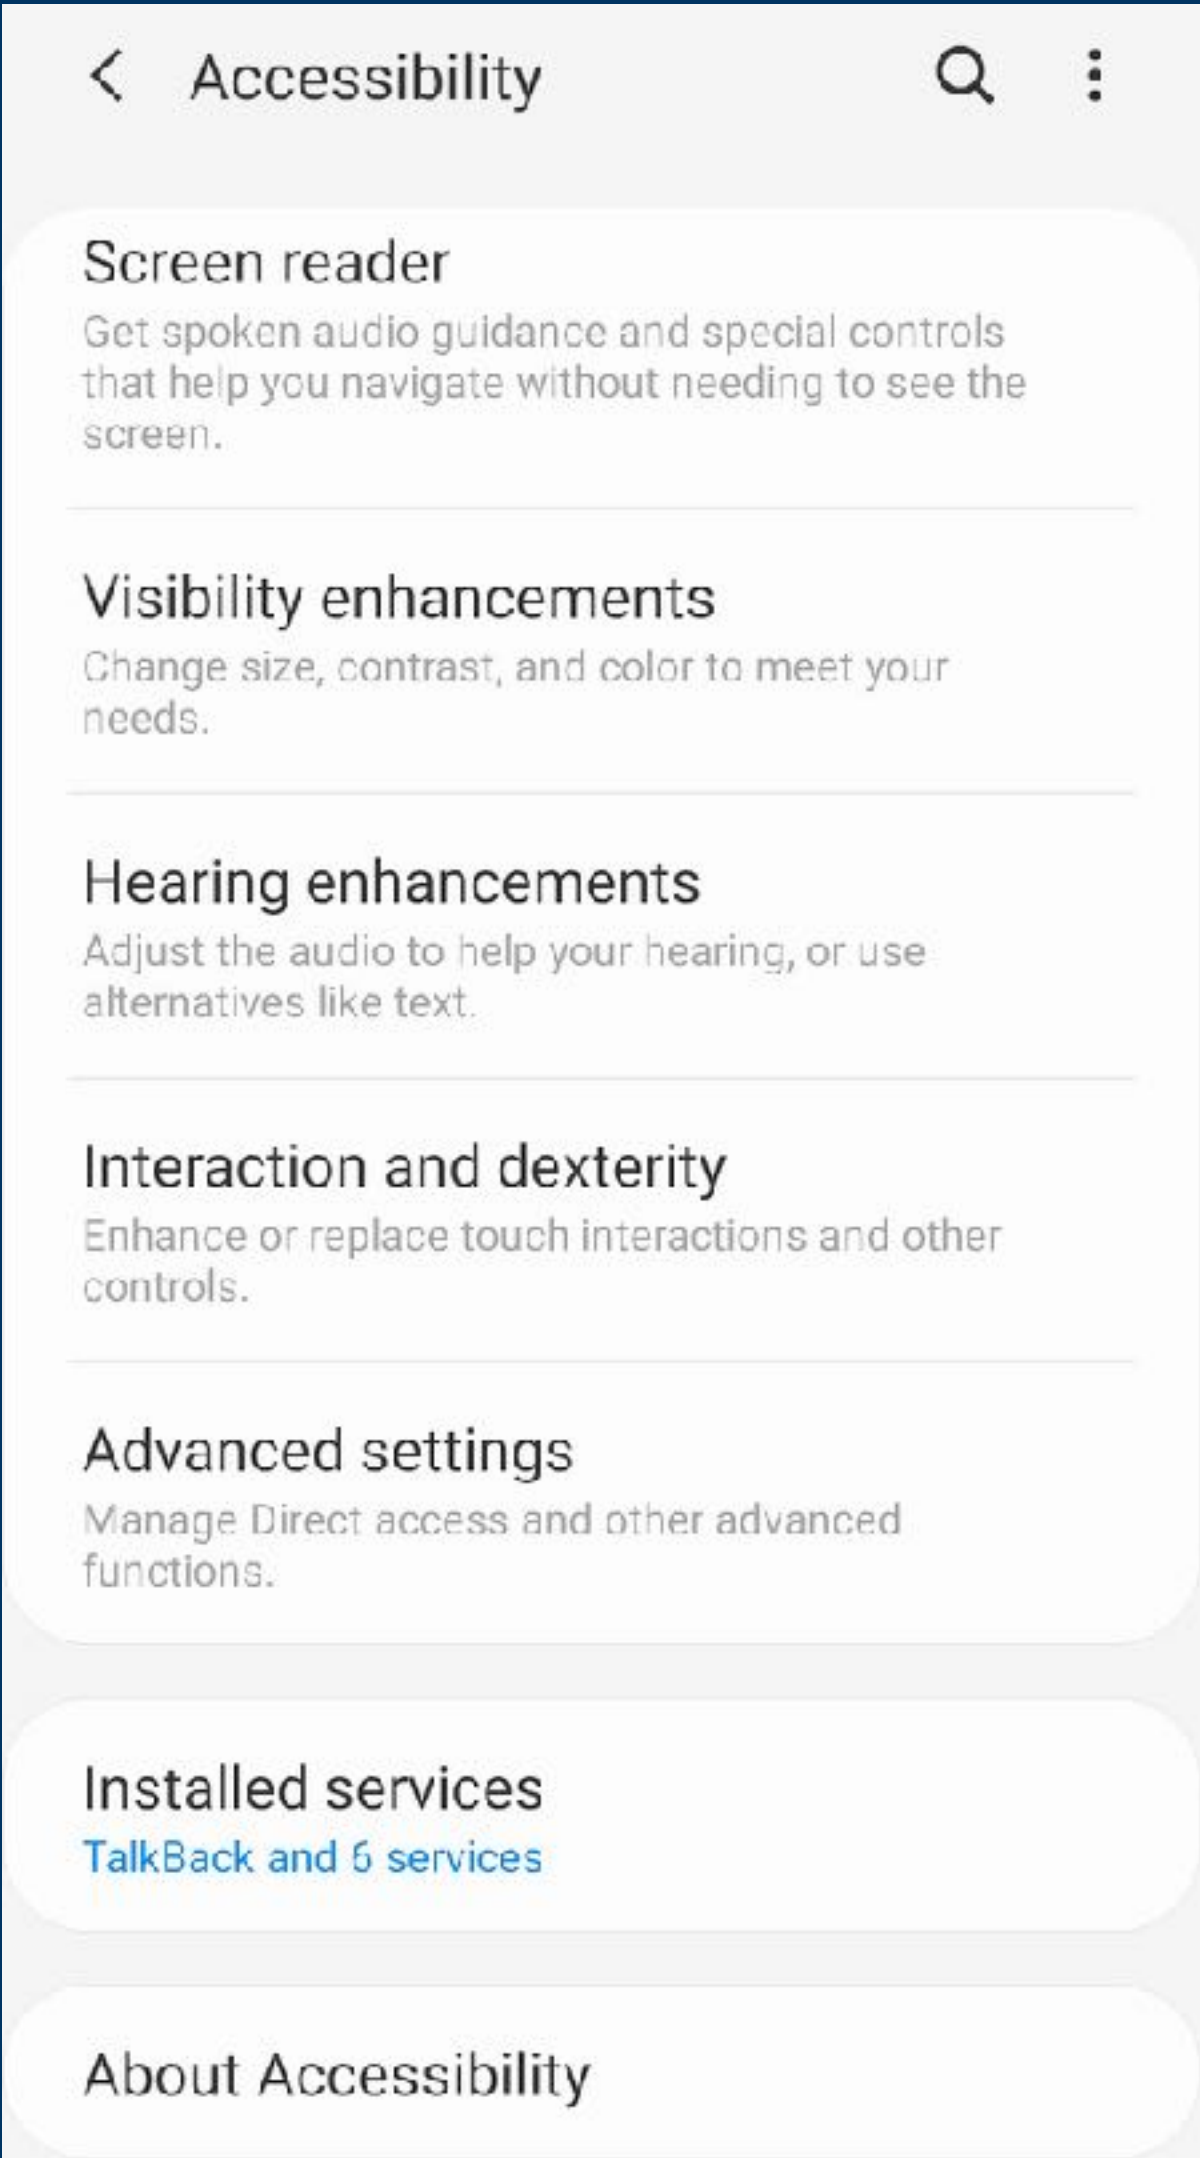

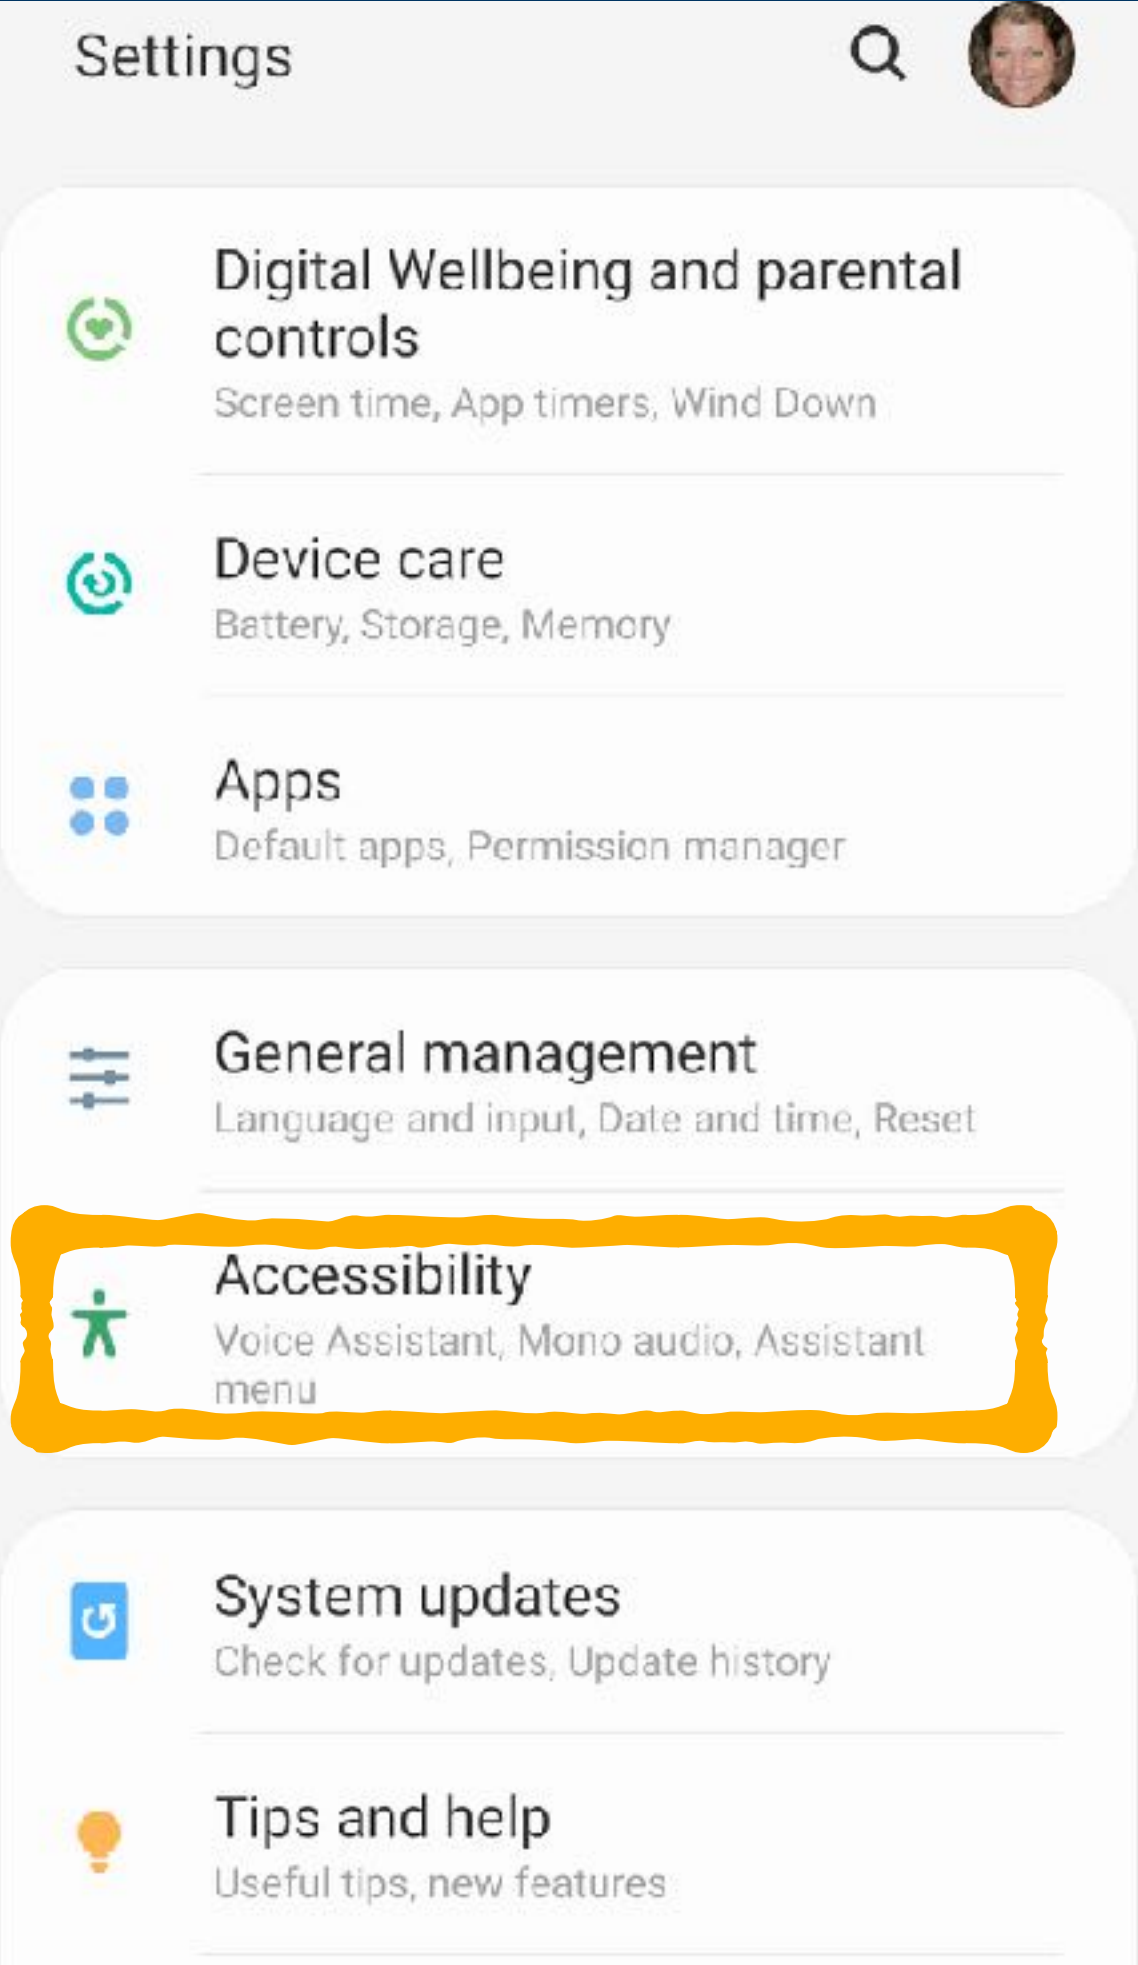

TAPSOS - Contact emergency services without needing to speak
